  - Informationals
    - \* [I-1] `PasswordStore::getPassword` natspec indicates a parameter that doesn't exist, causing the natspec to be incorrect.

## Protocol Summary

PasswordStore is a protocol dedicated to storage and retrieval of a user's passwords. The protocol is designed to be used by a single user, and is not designed to be used by multiple users. Only the owner should be able to set and access this password.

## Disclaimer

Claudia makes all effort to find as many vulnerabilities in the code in the given time period, but holds no responsibilities for the findings provided in this document. A security audit by the team is not an endorsement of the underlying business or product. The audit was time-boxed and the review of the code was solely on the security aspects of the Solidity implementation of the contracts.

## Risk Classification

		Impact		
		High	Medium	Low
Likelihood	High	H	H/M	M
	Medium	H/M	M	M/L
	Low	M	M/L	L

## Audit Details

- Commit Hash: 2a47715b30cf11ca82db148704e67652ad679cd8
- In Scope:

## Scope

```
1 ./src/  
2 |__PasswordStore.sol
```

## Roles

Owner: The user who can set the password and read the password. Outsiders: No one else should be able to set or read the password.

## Executive Summary

Auditing PasswordStore was rewarding, uncovering areas to improve security and efficiency.

## Issues found

Severity	Number of issues found
High	1
Medium	0
Low	0
Info	1
Gas	0
Total	2

## Findings

### High

**[H-1] PasswordStore::setPassword has no access control, meaning no-owner can change the password.**

**Description:** PasswordStore::setPassword function is set to external, however, the NatSpec of the function and overall of the smart contract is that This function should only allow the owner to set a new password.

Code

```
1 function setPassword(string memory newPassword) external {
2   @> s_password = newPassword;
3   emit SetNewPassword();
```

```
4 }
```

**Impact:** Anyone can set/change the password of the contract, severely breaking the contract's intended functionality.

**Proof of Concept:** Add the following to the `PasswordStore.t.sol` test file.

Code

```
1 function setPassword(string memory newPassword) external {
2   @> s_password = newPassword;
3   emit SetNewPassword();
4 }
```

**Recommendation:** Add access control conditional to the `setPassword` function.

```
1 if(msg.sender != s_owner) {
2   revert PasswordStore__NotOwner();
3 }
```

## Informationals

**[I-1] PasswordStore::getPassword natspec indicates a parameter that doesn't exist, causing the natspec to be incorrect.**

**Impact:** The natspec is incorrect.

**Recommendation:** Remove the incorrect natspec line.

```
1 - * @param newPassword The new password to set.
```
